

Useful wget examples

```
wget --recursive --no-clobber --no-parent --domains  
mirror.atl.genesisadaptive.com -R "index.html"  
http://mirror.atl.genesisadaptive.com/fedora/linux/releases/32/Server/x86_64  
/os/
```

This is useful for mirroring directories such as Linux download directories.

- recursive - downloads every directory
- no-clobber - do not replace files
- domains - limit download to a certain domain or sub-domain
- R "index.html" - don't save index.html files
